# What is PGT-M?

PGT-M (formerly PGD) helps significantly decrease the chance of having a child with an inherited genetic condition.

By analysing DNA from each embryo, unaffected embryos can be preferentially selected for transfer.

This test is indicated for couples at risk for passing on a single gene condition such as cystic fibrosis, fragile X syndrome, muscular dystrophy, Huntington disease, and many others.

## Benefits of PGT-M

Identifies embryos affected with a genetic condition prior to transfer.

Unique probe, custom-designed for every couple.

In-depth genetic counselling sessions available at no extra cost.

Igenomix understands each patient and situation is unique. It is our promise to customise the process to each couple's individual needs.

## How does it work?
